

Roser Systems[®]

All-in-one solution

Management software for plant shutdowns and maintenance

Introduction - After years of experience in preparation, scheduling and planning, and execution of plant shutdowns and turnarounds RoserConSys B.V. decided to develop its own maintenance software. We felt limited by the existing software solutions our clients were using. There had to be a better way, and so in 2001 Roser Systems[®] was launched! Our 'first born' has matured into a full- edged software application ever since. Roser Systems[®] has been successfully implemented at a number of major players in the (petro-) chemical industry.

A complete system for preparation and implementation of maintenance Roser Systems[®] focuses on the full integration of work where safety, quality, people, materials, hours, costs, inspections, scheduling and extra work come together and remain clear for all disciplines, departments and companies. The all-in-one approach of the system has only one goal: optimizing the quality and efficiency of maintenance.

Workpreparation - With Roser Systems[®] you can import data such as scopelists from an ERP/SAP system. You are able to create new scopes (e.g. work packages) by using standard structures. For each activity it is easy to make cost estimates, select materials, and add documents.

Scheduling - After verification and approval of the workpreparation the data can be easily exported, together with resources, costs and operational deadlines, to Plan-IT[®] or your own ERP system. The resulting schedule can be imported back into Roser Systems[®].

Management - Within Roser Systems[®] project monitoring is of key importance. The system provides a controlled workflow for progressing activities and phases. With use of ample reporting possibilities your progress status can be obtained at any time. The handover (quality assurance) module helps to establish, link and monitor your quality requirements. The materials module provides instant overview of received and issued materials.

Multi-user - With Roser Systems[®] the communication (reviews, photos, etc.) between departments can be simplified and centralized. It uses authorization and user group rights, this way both external personnel (e.g. contractors) and internal personnel from different departments can safely and concurrently use the software package.

All-in-one solution - Our software package offers an all-in-one solution for a smooth execution of all your maintenance. The software has many features you will not easily find elsewhere. Feel free to contact us for additional information or a non-binding presentation.

Roser Suite[®]

Roser Systems[®] is part of the Roser Software Suite[®]. This set of multiple software applications comprises of: Blind-IT[®], Weld-IT[®], Plan-IT[®], Scope-IT[®], Time-IT[®], Improve-IT[®], Change-IT[®] and Permit-IT[®]. All these applications integrate seamlessly with Roser Systems[®] and are mutually compatible. In addition all applications can be used as stand-alone.

Our mission:

Developing innovative software that adds value for our clients. Continue to improve this software based on (practical) experience and recommendations of our users with the aim to achieve an efficient, qualitative and safe preparation and execution of:

- General maintenance
- Maintenance and construction projects
- Daily and preventive maintenance
